

functioning, and ultimate self-sufficiency.

Data collection will be conducted over a 33-month period. A total of 1,600 participants will be recruited from eight sites. At each site, a documented treatment intervention will be tested in comparison to an alternative treatment condition. Participants will be interviewed at baseline (within two weeks of entering a program) as well as three additional times (3 months after program entry, 9 months after program entry, and 15 months after program entry). Trained interviewers will administer the interviews to

participating mothers. Information on the children will be obtained from the mother.

Key outcomes for the mothers are increased residential stability, decreased substance use, decreased psychological distress, improved mental health functioning, increased trauma recovery, improved health, improved functioning as a parent, and decreased personal violence. Outcomes for the children are reduced emotional/behavioral problems and improved school attendance.

To reduce burden and increase uniformity across the study sites, a central Coordinating Center will

develop and administer common data entry and tracking computer programs. A variety of quality control procedures will also be implemented to ensure the integrity and uniformity of the data collected. Data will be submitted to the Coordinating Center via electronic means. Training and technical assistance will be provided to all sites on data submission. Sites will be asked to follow uniform procedures for submitting their data.

The estimated response burden is as follows:

Interview	Number of respondents	Responses per respondent	Burden per response (hrs.)	Total burden hours
Screening—MINI	2,280	1	.25	570
Baseline	1,600	1	1.58	2,528
Follow-Up 1 (3 months)	1,600	1	1.25	2,000
Follow-Up 2 (9 months)	1,600	1	1.25	2,000
Follow-Up 3 (15 months)	1,600	1	1.25	2,000
Total	2,280			9,098
3-yr annual average	2,280			3,032
