

The present invention provides methods useful for altering cell proliferation by modifying SPATIAL, a gene expressed predominantly in thymus and lymph node, activity in cells. In some methods the thymocyte numbers in subjects with disease-associated immunodeficiencies are increased by administering an agent that inhibits SPATIAL activity. Other methods include but are not limited to increasing thymocyte number in a subject by administering an agent that interferes with an interaction between SPATIAL and Uba3.

Methods for the Treatment of Parkinson's Disease and Other alpha-synucleinopathies

Parkinson's disease (PD) is a neurodegenerative disorder characterized by the loss of dopaminergic neurons in the substantia nigra pars compacta. During the course of the disease, proteinaceous cytoplasmic inclusions known as Lewy bodies appear in the dopaminergic neurons. Several lines of evidence point to a key role for alpha-synuclein, a major constituent of Lewy bodies, in the pathogenesis of these disorders. In particular, the aggregation of this protein is believed to be deleterious to neurons. These inventors have now discovered that transglutaminase 2, also referred to as tissue transglutaminase, catalyzes alpha-synuclein cross-linking in vitro and in cultured cells. Evidence for the activity of this enzyme is also provided within the Lewy bodies in Parkinson's patients. The present invention provides novel methods for the treatment of Parkinson's disease and other alpha-synucleinopathies with inhibitors of transglutaminase, which can inhibit aggregation of alpha-synuclein. Also provided are screening assays for novel inhibitors of transglutaminase that may be used in the treatment of Parkinson's disease and other alpha-synucleinopathies. Further information may be found in Junn *et al.*, PNAS 2003 100(4): 2047-2052.
