

SIM system includes a radial aperture block positioned at a plane conjugate to the back focal plane of the objective lens, thus allowing only high-angle marginal annular light beams from a laser source to excite the sample. The radial aperture block can be replaced with a digital micromirror device for varying the evanescent wave to allow nanometric localization of features in the axial direction. A spatial light modulator (SLM) can be used to alter the phase of the excitation to optimally induce evanescent, patterned excitation at the sample. Various embodiments of the TIRF/SIM system allows for high-speed, super-resolution microscopy at very high signal-to-noise (SNR) ratios for biological applications within ~200 nm (e.g., the evanescent wave decay length) distance of a coverslip surface.

Potential Commercial Applications:

- High speed microscopy.

Competitive Advantages: • Low cost of manufacture.

Development Stage: • Prototype.
