

Trunked Transport, Entrance Facilities for switched access traffic, Tandem Switched Transport, and Signaling for Tandem Switching (*i.e.*, Local Switching gets at least its proportionate share of reductions).

(3) After a price cap local exchange carrier reaches the Target Rate as set forth in § 61.3(qq), the ATS Rate will be recalculated each subsequent Annual Filing. This process will identify the new ATS Charge for the new base period level. Due to change in base period demand and inclusion of new services for that annual filing, the absolute level of a tariff entity's ATS Charge may change. The resulting new ATS Charge level will be what that tariff entity will be measured against during that base period. For example, if a company whose target is \$0.0055 reached the Target Rate during the 2000 annual filing, that level may change to \$0.0058 in the 2001 annual filing due to change in demand and inclusion of new services. Therefore, it will be the \$0.0058 average rate that the tariff entity will be measured against for all non-annual filings. Likewise, if that same company was at the Target Rate during the 2000 filing, that level may change to \$0.0053 average rate in the 2001 annual filing due to change in demand and inclusion of new services. In that case, it will be at the \$0.0053 average rate that the tariff entity will be measured.

(4) A company electing a \$0.0095 Target Rate will, in the tariff year it reaches the Target Rate, apply any Targeted Revenue Differential remaining after reaching the Target Rate to reduce Average Price Cap CMT Revenue per Line month until the CCL charge is eliminated. In subsequent years, until the earlier of June 30, 2004 or when the CCL charge is eliminated, tariff filing entities with a Target Rate of \$0.0095, or the portion of a filing entity consolidated pursuant to § 61.48(o) that, prior to such consolidation, had a Target Rate of \$0.0095, will reduce Average Price Cap CMT Revenue per Line month according to the following method:

(i) Filing entity calculates the maximum allowable carrier common line revenue, as defined in § 61.46(d)(1), that would be permitted in the absence of

further adjustment pursuant to this paragraph;

(ii) Filing entity identifies maximum amount of dollars available to reduce Average Price Cap CMT Revenue per Line month by the following:

$$\begin{aligned} & (\text{CMT revenue in a \$0.0095 Area} - \text{CCL} \\ & \text{revenue in a \$0.0095 Area}) * (\text{GDP-PI} - \\ & \text{X}) + (\text{CCL Revenue in a \$0.0095 Area}) \\ & * [(\text{GDP-PI} - \text{X}) - (g/2)] / [1 + (g/2)] \end{aligned}$$

(iii) The Average Price Cap CMT Revenue per Line month shall then be reduced by the lesser of the amount described in paragraph (i)(4)(i) of this section and the amount described in paragraph (i)(4)(ii) of this section, divided by base period Switched Access End User Common Line Charge lines.

#### § 61.46 Adjustments to the API.

(a) Except as provided in paragraphs (d) and (e) of this section, in connection with any price cap tariff filing proposing rate changes, the carrier must calculate an API for each affected basket pursuant to the following methodology:

$$\text{API}_t = \text{API}_{t-1} [\sum_i v_i (P_i/P_{t-1})^i]$$

Where:

API<sub>t</sub> = the proposed API value,

API<sub>t-1</sub> = the existing API value,

P<sub>i</sub> = the proposed price for rate element "i,"

P<sub>t-1</sub> = the existing price for rate element "i,"

and

v<sub>i</sub> = the current estimated revenue weight for rate element "i," calculated as the ratio of the base period demand for the rate element "i" priced at the existing rate, to the base period demand for the entire basket of services priced at existing rates.

(b) New services subject to price cap regulation must be included in the appropriate API calculations under paragraph (a) of this section beginning at the first annual price cap tariff filing following completion of the base period in which they are introduced. This index adjustment requires that the demand for the new service during the base period must be included in determining the weights used in calculating the API.

(c) Any price cap tariff filing proposing rate restructuring shall require an adjustment to the API pursuant to the general methodology described in

paragraph (a) of this section. This adjustment requires the conversion of existing rates into rates of equivalent value under the proposed structure, and then the comparison of the existing rates that have been converted to reflect restructuring to the proposed restructured rates. This calculation may require use of carrier data and estimation techniques to assign customers of the preexisting service to those services (including the new restructured service) that will remain or become available after restructuring.

(d) The maximum allowable carrier common line (CCL) revenue shall be computed pursuant to the following methodology:

CCL = CMT – EUCL – Interstate Access Universal Service Support Mechanism Per Line – PICC

Where:

CMT = Price Cap CMT Revenue as defined in § 61.3(cc).

EUCL = Maximum allowable EUCL rates established pursuant to § 69.152 of this chapter multiplied by base period lines.

Interstate Access Universal Service Support Per Line = the amount as determined by the Administrator pursuant to § 54.807 of this chapter times the number of base period lines for each customer class and zone receiving Interstate Access Universal Service support pursuant to part 54, subpart J.

PICC = Maximum allowable PICC rates established pursuant to § 69.153 of this chapter multiplied by base period lines.

(e) In no case shall a price cap local exchange carrier include data associated with services offered pursuant to contract tariff in the calculations required by this section.

[65 FR 38698, June 21, 2000; 65 FR 57741, 57742, Sept. 26, 2000]

#### § 61.47 Adjustments to the SBI; pricing bands.

(a) In connection with any price cap tariff filing proposing changes in the rates of services in service categories, subcategories, or density zones, the carrier must calculate an SBI value for each affected service category, subcategory, or density zone pursuant to the following methodology:

$$SBI_t = SBI_{t-1} [\sum_i v_i (P_t/P_{t-1})_i]$$

where

SBI<sub>t</sub> = the proposed SBI value,

SBI<sub>t-1</sub> = the existing SBI value,

P<sub>t</sub> = the proposed price for rate element “i,”

P<sub>t-1</sub> = the existing price for rate element “i,” and

v<sub>i</sub> = the current estimated revenue weight for rate element “i,” calculated as the ratio of the base period demand for the rate element “i” priced at the existing rate, to the base period demand for the entire group of rate elements comprising the service category priced at existing rates.

(b) New services that are added to existing service categories or subcategories must be included in the appropriate SBI calculations under paragraph (a) of this section beginning at the first annual price cap tariff filing following completion of the base period in which they are introduced. This index adjustment requires that the demand for the new service during the base period must be included in determining the weights used in calculating the SBI.

(c) In the event that the introduction of a new service requires the creation of a new service category or subcategory, a new SBI must be established for that service category or subcategory beginning at the first annual price cap tariff filing following completion of the base period in which the new service is introduced. The new SBI should be initialized at a value of 100, corresponding to the service category or subcategory rates in effect the last day of the base period, and thereafter should be adjusted as provided in paragraph (a) of this section.

(d) Any price cap tariff filing proposing rate restructuring shall require an adjustment to the affected SBI pursuant to the general methodology described in paragraph (a) of this section. This adjustment requires the conversion of existing rates in the rate element group into rates of equivalent value under the proposed structure, and then the comparison of the existing rates that have been converted to reflect restructuring to the proposed restructured rates. This calculation may require use of carrier data and estimation techniques to assign customers of the preexisting service to those services (including the new restructured service) that will remain or become available after restructuring.
