Identification of a Novel Folliculin Interacting Protein, FNIP–1

Description of Technology: Renal cell carcinoma is an important health problem in the United States, affecting 32,000 individuals each year and resulting in 12,000 deaths annually. Several familial cancer disorders with a renal epithelial tumor phenotype have been well characterized and the causative genes have been identified including the Birt-Hogg-Dube (BHD) gene. The BHD gene encodes a protein called folliculin. Mutations in BHD lead to the development of Birt-Hogg Dube syndrome, a dermatologic disorder associated with an increased risk for developing renal cancer, spontaneous pneumothorax and lung cysts.

This invention describes the cloning and characterization of the first folliculin interacting protein FNIP–1 and purified antibodies that selectively bind to an epitope of FNIP–1. FNIP–1 interacts with subunits of AMP-dependent protein kinase (AMPK). The FNIP–1/AMPK interaction places FNIP–1 and folliculin as potential interactors in cellular pathways essential for regulating cell growth and cell size. FNIP–1 may play an important role in

folliculin's function. Identification of the FNIP–1 cDNA sequence will enable evaluation of sporadic renal tumors, enable the development of cancer diagnostics and aid in the treatment of BHD skin lesions.

Bone Morphogenetic Variants, Compositions and Methods of Treatment

Description of Technology: The invention identifies proteins belonging to TGF-Beta superfamily that promote repair of menisci, cruciate and collateral ligaments of the knee, and rotator cuff tendons. The application claims nucleic acids encoding human Cartilage-Derived Morphogenetic Protein-1 (hCDMP–1) variant polypeptides. Morphogenetic proteins are able to induce the proliferation and differentiation of progenitor cells into functional bone, cartilage, tendon, or ligament tissue.
