BILLING CODE 7590-01-P

**[Docket No. 50-397]**

**Washington Public Power Supply System; Notice of Consideration of Issuance of Amendment to Facility Operating License, Proposed No Significant Hazards Consideration Determination, and Opportunity for a Hearing**

The U.S. Nuclear Regulatory Commission (the Commission) is considering issuance of an amendment to Facility Operating License No. NPF-21 issued to Washington Public Power Supply System (WPPSS, also the licensee) for operation of the WPPSS Nuclear Project No. 2 located on Hanford Reservation in Benton County, Washington.

The proposed amendment would add a reactor water cleanup (RWCU) system high blowdown containment isolation trip function and associated Limiting Condition for Operation (LCO) and surveillance requirements to Technical Specification (TS) Tables 3.3.2-1, 3.3.2-2, and 4.3.2.1-1.

Before issuance of the proposed license amendment, the Commission

will have made findings required by the Atomic Energy Act of 1954, as amended (the Act) and the Commission's regulations.

The Commission has made a proposed determination that the amendment request involves no significant hazards consideration. Under the Commission's regulations in 10 CFR 50.92, this means that operation of the facility in accordance with the proposed amendment would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the change involve a significant increase in the probability or consequences of an accident previously evaluated?

The proposed amendment incorporates design features being implemented to reduce the detection and isolation time for a postulated High Energy Line Break (HELB) at the piping connection to the Reactor Water Cleanup (RWCU) system blowdown flow control valve. These design features significantly improve the capability to detect and mitigate the effects of the line break and are necessary to resolve Reactor Building environmental concerns. Since the design features are for accident detection and mitigation, they are not considered an accident initiator in the analyses and will not increase the probability of the accident. Moreover, the instrumentation design ensures that no single failure would preclude isolation of the HELB.

The proposed amendment does not remove or modify any existing Technical Specification requirements, but imposes additional requirements related to the new "Blowdown Flow—High" trip function consistent with existing Limiting Condition for Operation (LCO) and surveillance requirements, conservative analyses, and instrumentation setpoint methodologies. These requirements will maintain the Reactor Building environment consistent with the current analyses for the postulated RWCU HELB and provide assurance that the radiological effects of the line break are bounded by the accident analysis for the design basis Main Steam line break (MSLB) outside containment. The calculated offsite doses for the MSLB are less than 10% of the 10 CFR 100 guideline values and meet the acceptance criteria of Standard Review Plan (NUREG-0800) 15.6.4.

On the basis of the information presented above, it is concluded that the change does not involve a significant increase in the
