**Title:** Temperature Calibration Wafer For Rapid Thermal Processing Using Thin-Film Thermocouples.

**Abstract:** This invention enables the measurement of temperature and the calibration of temperature measurements in rapid thermal processing tools for silicon wafer processing to a greater accuracy than previously possible. The invention is a device which is a calibration wafer of novel construction and capabilities. The calibration wafer is comprised of an array of junctions of thin film thermocouples which traverse the silicon wafer (typically 200 mm in diameter) and are welded to thermocouple wires of the same composition as the thin films. The advantages of very low mass thin-film thermocouples in making these measurements are greatest under the extremely high heat flux conditions present in rapid thermal processing tools (100 w/cm<sup>2</sup>). In order to achieve these measurements with thin-film thermocouples at temperatures ranging up to 900 degrees celsius a novel approach was taken in the design and fabrication of the wafer including the incorporation of an adhesion film for the thermoelements, diffusion barriers, and high temperature dielectric insulators.

**Title:** System For Stabilizing And Controlling A Hoisted Load.

**Abstract:** The invention provides a system which can both be adapted to existing single point lift mechanisms, and constrain a hoisted load in all six degrees of freedom, includes a suspension point, an assembly, a lateral tension lines member, and a control system. The assembly includes first and second platforms connected by a plurality of control cables which can precisely control the position, velocity, and force of a hoisted element in six degrees of freedom. The position or tension of the control lines can be controlled either manually, automatically by computer, or in various combinations of manual and automatic control. Advantages associated with the system include not only the ability to control the position, velocity, and force of the attached load, tool, and/or equipment in six degrees of freedom using position and tension feedback, but its ready adaptation to existing single point lift mechanisms and relatively light weight, and its

flexibility, ease, and precision of operation.

**Title:** Rapid Fluorescence Detection Of Binding To Nucleic Acid Drug Targets Labeled With Highly Fluorescent Nucleotide Base Analogs.

**Abstract:** This invention is available for nonexclusive licensing. A method is disclosed for selective substitution of highly fluorescent nucleotide base analogs within the sequence of nucleic acid drug targets, such that these bases can be used as probes to monitor/screen for the interaction of ligands with a nucleic acid target. In designing the fluorescent nucleic acid target, information about the nucleic acid structure and its native interaction with other macromolecules is used to engineer fluorescent analogs that display fluorescence emission quantum yields that are sensitive to interactions with ligands and/or other macromolecules. The general method of using changes in the fluorescence emission spectra as a probe for the interaction of the nucleic acid target with ligands has been named Fluorescence Emission Perturbation (FREP).
