The wall structure includes passages therein. A gasket is disposed on the support surface so as not to cover the aperture. A first transparent cover is disposed on the gasket so as to cover the aperture. A water bath body is provided and has a first portion and a second portion extending from the first portion. The first portion defines a second support surface. The second portion is received in the interior of the cell chamber body and is in interference fit arrangement with the wall structure. The water bath body has an interior support surface with an aperture there through. The aperture extends through

the first and second portions. The first portion has first ports therein which communicate with the aperture of the water bath body. The second portion includes second ports therein which communicate with the aperture of the water bath body and with associated passages in the cell chamber body. A second transparent cover is disposed on the interior support surface of the water bath body so as to divide the aperture of the water bath body into first and second portions. The second transparent cover covers the second portion of the aperture to define a sealed cell chamber enclosed by the second transparent cover, the first transparent cover and surfaces of the cell chamber body. A transparent window is disposed on the second support surface to cover the first portion of the aperture to define a water bath chamber enclosed by the transparent window, the second cover and surfaces of the water bath body. Whereby fluid may enter and exit the water bath chamber via first ports and perfusion fluid may enter and exit the cell chamber via the second ports.
