

optical space for micromanipulation or probing (e.g., drug testing, transgenic manipulation, nucleation/anucleation). The software permits the selection of an object for targeting by a point and click operation with a computer mouse, and performs the transforms between video pixel space, optical space and micromanipulator mechanical coordinate space to translate the point and click operation into the precision targeting movements of the micro-positioner. The object is viewed in real time through a microscope system via a video output camera and displayed on a computer terminal.

Applications include a variety of biological laboratory precision tools such as positioning of microelectrodes for electrophysiological recording from living cells, micro-injection and micromanipulation of cells and micro-delivery of pharmacological agents to cells for drug testing and diagnostics.

The invention may also find application in microelectronics fabrication.
