SUPPLEMENTARY INFORMATION: This technology describes fully human monoclonal antibodies that have been affinity matured against IGF-I and IGF-II and display extremely high affinities for IGF-I and IGF-II in the picoM range. Some of these antibodies potentially inhibited signal transduction mediated by the IGF-1R interaction with IGF-I and IGF-II and blocked phosphorylation of IGF-IR and the insulin receptor. In addition, they inhibited migration in the MCF-7 breast cancer cell line at the picoM range. Therefore, these antibodies could be used to prevent binding of IGF-I and/or IGF-II to its concomitant receptor IGFIR, consequently, modulating diseases such as cancer.
