Novel Anti-HIV Proteins From Coral Reefs

Description of Technology: The subject invention describes Cnidarins as a novel class of highly potent proteins capable of blocking the HIV virus from penetrating T-cells. Cnidarins were found in a soft coral collected in waters off Australia's northern coast. Cnidarins can block virus fusion/entry but do not block viral attachment. In addition, Cnidarins do not have lectin-like activity and therefore possibly a unique mechanism of action. Thus, Cnidarins may represent important new leads for HIV microbicides or for systemic therapeutics for HIV.

Potential Commercial Applications: Microbicide; Therapeutic; Research tool.

Competitive Advantages: High potency against HIV; Novel chemical composition; Family of related proteins; Unique mechanism of action.

Development Stage: Early-stage; In vitro data available; Prototype.

of their broader antiviral activity as well as additional pre-clinical studies. For collaboration opportunities, please contact John D. Hewes, Ph.D. at hewesj@mail.nih.gov.
