

THE ADA AUDIO SOLUTION

Many older and current cinema processors were not designed to accommodate the visual narration sound track. With Dolby 7.1 playback there are not enough channels to accommodate the main audio plus the visual narration. The DAX-202 was designed to solve this problem. This unit can source the visual narration signal from any of several audio channels on the server.

The DAX-202 is designed to connect the server and the IR or RF transmitters for hearing impaired (HI) and visual narration (VI-N) channels. Internally the user can select AES-EBU channel 7/8, 15/16 or an external BNC input. Using the cinema automation, the user can select the HI channel from the cinema processor or the server audio.
